01 / WHY REFERENCES NEED A CHECK

AI can sound convincing. References still need evidence.

ChatGPT, Gemini and Claude use large language models (LLMs).

LLMs predict text. They can invent a reference or mix up its details.

A real paper can still have the wrong author, title, year or venue.

DBLP is a publication catalog. INGOAMPT makes it searchable.

Computer-science records, structured in SQLite and a search index.

Publication details and links, rather than millions of full papers.

8.56M searchable entries | About 53 GB of local files

Recorded pilot snapshot. DBLP supplies the underlying bibliographic data.

03 / HOW YOUR CHAT REACHES THE LOCAL CHECKER

Your chat. Our service. Local DBLP on a Mac.

MCP = Model Context Protocol

Selected references go out. Findings and evidence come back.

The database stays on the Mac. You download nothing.

Free pilot while the Mac is online. Cloud hosting is possible, with costs.

Submitted references are processed by INGOAMPT.

Read the privacy notice before checking your own references.

04 / A FINAL CHECK FOR YOUR PAPER OR THESIS

Before you submit: copy, check, review.

BERT | NAACL paper

Local DBLP + ACL Anthology

2020 → **2019**

Conference publication year

PRISMA 2020

Publisher / web follow-up

2020 → **2021**

Keep "2020" in the title

Worked examples from the website demo

1. **Connect once**
2. **Paste references**
3. **Open sources**

Check supported fields; review the sources before making corrections.

For PhD students, professors and anyone preparing a paper.

Try the two public references on the MCP page.

A DBLP miss needs more review. It does not prove a paper is fake.
